CLAIMS

- 1. A process for the removal of the hydrogen sulfide contained in natural gas, including:
- a) absorbing the hydrogen sulfide present in natural gas by means of a virgin naphtha, essentially consisting of C₅-C₈ paraffins, in an adsorbing device and with a molar ratio virgin naphtha/H₂S of between 0.85 and 1.5;

5

15

- b) recovering the hydrogen sulfide absorbed by the virgin naphtha as head product of a distillation column operating with a reflux having a temperature ranging from -5 to -20°C;
 - c) recycling the virgin naphtha discharged as bottom product of the distillation column, to the absorption step (a);
 - d) introducing the hydrogen sulfide back to the production field of natural gas, at the temperature and pressure conditions present at the head of the distillation column.
- 20 2. The process according to claim 1, wherein the natural gas is pre-treated to eliminate carbon dioxide.
 - 3. The process according to claims 1 or 2, wherein the absorption step is effected in a filling column.
- The process according any of the previous claims,
 wherein the absorption step is effected at room tempera-

ture.

5. The process according any of the previous claims, wherein the distillation column operates at a head temperature of between -9 and $-15\,^{\circ}\text{C}$.
